

The survey team mapped the valley floor during the dry months, walking the same line every morning so that changes in the river bed could be compared from one week to the next.

*Figure 1. The river bed at the northern ford, seen from the survey post on the eastern bank.*

After the first rains the ford was no longer passable on foot, and the team moved its post two kilometres downstream, where a stone bridge offered a dry crossing and a clear view of the meanders.
